

HTML5

HTML5 is the latest version of the HTML standard. It is designed to be a single language for all devices, including desktop computers, smartphones, and tablets. It introduces new features like video and audio tags, and a more robust form control system. Internet Explorer 9 and other modern browsers support HTML5. It is the foundation for modern web applications.

HTML5

HTML5 is part of the Web Applications 1.0 specification, which was developed by the WHATWG group in 2004. It was later standardized by the W3C in 2008. It is a key technology for building modern web applications.

HTML5 is the successor to HTML4.
